AT60

Receiving Card

V1.0.1
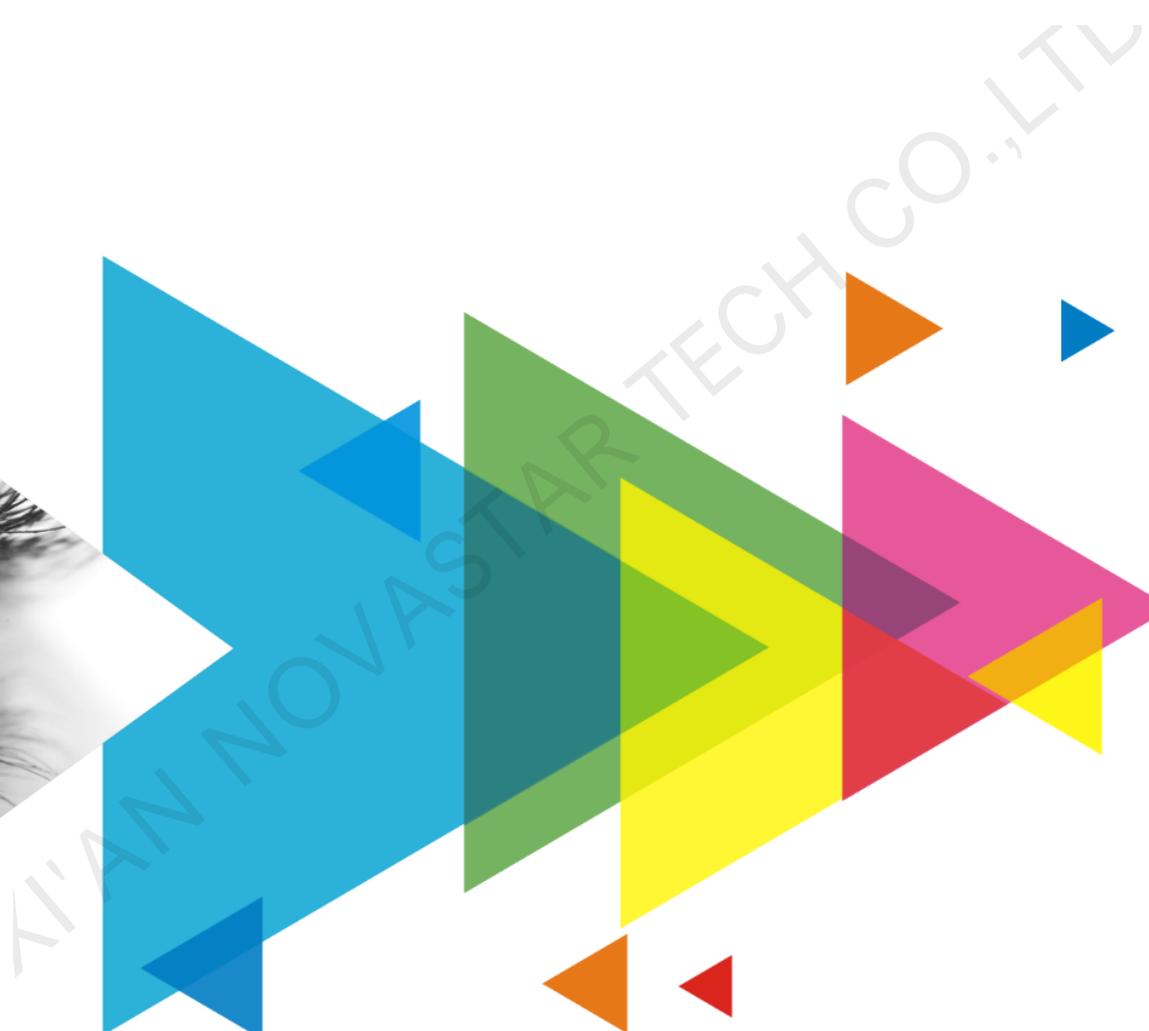

Specifications

Change History

Document Version	Firmware Version	Release Date	Description
V1.0.1	V4.6.2.0	2020-04-09	• Updated the firmware version. • Updated the indicator description.
V1.0.0	V4.6.1.0	2020-01-02	First release

Introduction

The AT60 is a general small receiving card developed by NovaStar. A single AT60 loads up to 512×256 pixels. With various highlights such as pixel level brightness and chroma calibration, individual Gamma adjustment for RGB, 3D function, 18bit+ and low latency, the AT60 can greatly improve the display effect and user experience.

The AT60 uses high-density connectors for communication to limit effects of dust and vibration, resulting in high stability and reliability. It supports up to 32 groups of parallel RGB data or 64 groups of serial data (extendable to 128 groups of serial data). Its reserved pins allow for custom functions of users. Thanks to its EMC Class B compliant hardware design, the AT60 has improved electromagnetic compatibility and is suitable to many applications.

Features

Improvements to Display Effect

- Pixel level brightness and chroma calibration
  Working with NovaLCT and NovaCLB, the receiving card supports brightness and chroma calibration on each LED, which can effectively remove color discrepancies and greatly improve LED display brightness and chroma consistency, allowing for better image quality.

- Quick seam correction
  Working with NovaLCT, the receiving card supports quick adjustment of bright or dark lines caused by splicing of cabinets and modules. This function is easy to use and the adjustment takes effect immediately.

  In NovaLCT (V5.2.0 or later), seam correction can be performed without using or changing the video source.

- Low latency
  The receiving card can reduce the frame latency of video source on the receiving card end to one frame (only when using modules with driver IC with built-in RAM).

- 3D function
  When the receiving card works with the independent controller which supports 3D function, users can enable the 3D function in NovaLCT or on operation panel of the controller, and set 3D parameters to allow for 3D display effects.

- Individual Gamma adjustment for RGB
  Working with NovaLCT (V5.2.0 or later) and the independent controller which supports this function, the receiving card supports individual adjustment of red Gamma, green Gamma and blue Gamma, which can effectively control image non-uniformity under low grayscale and white balance offset, allowing for a more realistic image.

- 18Bit+
  Activation of 18Bit+ mode in NovaLCT can improve LED display grayscale by 4 times, avoiding grayscale loss due to low brightness and allowing for a finer image.

- Image rotation in 90° increments
  In NovaLCT, the display image can be set to rotate in multiples of 90° (0°, 90°, 180° and 270°).

Improvements to Maintainability

- Smart module (supported by dedicated firmware)
  The smart module is composed of Flash and MCU.

  Flash can store calibration coefficients and module parameters. MCU can communicate with the receiving card to monitor temperature, voltage and ribbon cable communication status at the module level. Working with the driver chip, MCU also supports LED error detection.

  The smart module allows for a smaller monitoring unit, requiring no independent monitoring card and saving cabinet space.

- Automatic module calibration
  After the module (with module Flash) has been replaced and power is supplied, the receiving card can automatically read the new module ID

and calibration coefficients, and save them to the receiving card.

- Module Flash management
  Module Flash information can be managed in NovaLCT. The module ID can be managed, and calibration coefficients and module parameters can be stored in the module Flash.

- One-click application of calibration coefficients saved in module Flash
  In the event of network outage, users can hold down the self-test button to read the calibration coefficients in module Flash back to the receiving card.

- Mapping function
  After the Mapping function is enabled in NovaLCT, each of the target cabinets will display the receiving card number and Ethernet port information, allowing users to easily obtain the location and wiring route of receiving cards.

- Setting of pre-stored image on receiving card
  In NovaLCT, a specified image can be set as the LED screen startup image or as the image to be displayed on LED screen when the Ethernet cable is disconnected or no video signal is available.

- Voltage and temperature monitoring
  The voltage and temperature of the receiving card can be monitored without using peripherals. The monitoring data can be checked in NovaLCT.

- Cabinet LCD
  The receiving card supports the LCD connected to the cabinet. The LCD can display temperature, voltage, single operating time and total operating time of the receiving card.

- Bit error rate monitoring
  The receiving card can work with NovaLCT (V5.2.0 or later) to monitor the network communication quality between the sending device and receiving card, or between receiving cards, and record the number of erroneous packets to help troubleshoot network communication problems.

- Readback of firmware program
  In NovaLCT (V5.2.0 or later), the receiving card firmware program can be read back and saved to local computer.

- Readback of configuration parameters
  In NovaLCT, the receiving card configuration parameters can be read back and saved to local computer.

Improvements to Reliability

- Dual-card backup and status monitoring
  In an environment with requirements for high reliability, two receiving cards can be mounted onto a single HUB board. In the case that main receiving card fails, the backup card will serve to ensure uninterrupted operation of the display.

  The working status of main and backup receiving cards can be monitored in NovaLCT (V5.2.0 or later).

- Status monitoring of dual power supplies
  The receiving card supports dual power supplies and can detect whether their working statuses are normal.

- Loop backup
  The receiving card can improve the reliability for cascading of receiving cards through main and backup redundant mechanism. If either main or backup cascading lines fail, the other will begin to work to ensure uninterrupted operation of the display.

- Dual backup of program
  Two copies of application programs are saved in the receiving card at the factory to avoid the problem that the receiving card may get stuck due to program update exception.

Appearance

Power Indicator Running Indicator

High-Density Connector

All product pictures shown in this document are for illustration purpose only. Actual product may vary.

Indicators

Indicator	Color	Status	Description
Running indicator	Green	Flashing once every other 1s	Receiving card is functioning normally. Ethernet cable connection is normal, and video source input is available.
		Flashing once every other 3s	Ethernet cable connection is abnormal.
		Flashing 3 times every other 1s	Ethernet cable connection is normal, but no video source input is available.
		Flashing every other 0.2s	Receiving card failed to load the program in the application area and now is using the backup program.
		Flashing 8 times every other 1s	A redundancy switchover occurred on the Ethernet port and the loop backup has taken effect.
Power indicator	Red	Always on	The power input is normal.

Dimensions
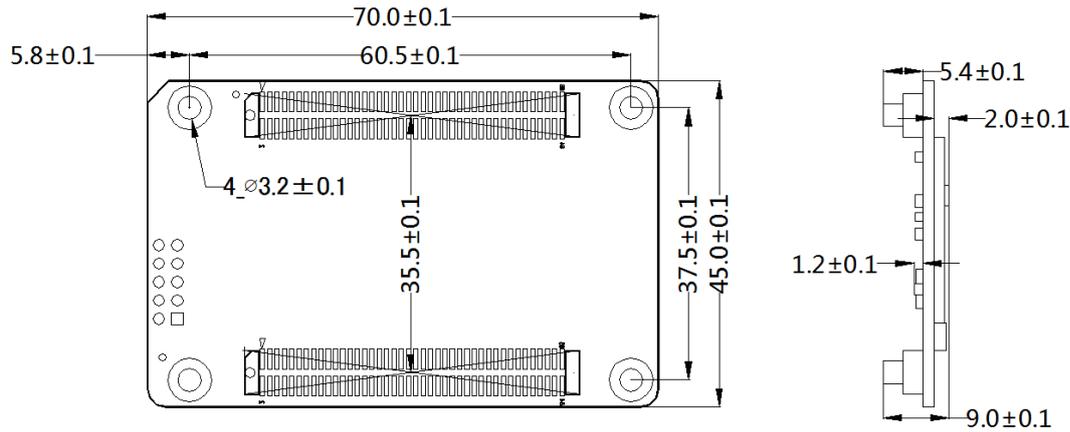

Unit: mm

Note:

The distance between outer surfaces of AT60 and HUB boards after their high-density connectors fit together is 8.0 mm. An 8-mm copper pillar is recommended.

Reference Design for Extended Functions

Description of Pins for Extended Functions			
Pin	Recommended Module Flash Pin	Recommended Smart Module Pin	Description
RFU4	HUB_SPI_CLK	Reserved	Clock signal of serial pin
RFU6	HUB_SPI_CS	Reserved	CS signal of serial pin
RFU8	HUB_SPI_MOSI	/	Module Flash storage data input
	/	HUB_UART_TX	Smart module TX signal
RFU10	HUB_SPI_MISO	/	Module Flash storage data output
	/	HUB_UART_RX	Smart module RX signal
RFU3	HUB_CODE0		Module Flash BUS control pin
RFU5	HUB_CODE1		
RFU7	HUB_CODE2		
RFU9	HUB_CODE3		
RFU14	POWER_STA1		Dual power supply detection signal
RFU16	POWER_STA2		
RFU15	MS_DATA		Dual-card backup connection signal
RFU17	MS_ID		Dual-card backup identifier signal

Note:

The RFU8 and RFU10 are signal multiplex extension pins. Only one pin from either the Recommended Smart Module Pin or the Recommended Module Flash Pin can be selected at the same time.

Specifications

Maximum Loading Capacity	512×256 pixels	
Electrical Specifications	Input voltage	DC 3.3 V–5.5 V
	Rated current	0.6 A
	Rated power consumption	3.0 W
Operating Environment	Temperature	−20°C to +70°C
	Humidity	10% RH to 90% RH, non-condensing
Storage Environment	Temperature	−25°C to +125°C
	Humidity	0% RH to 95% RH, non-condensing
Physical Specifications	Dimensions	70.0 mm × 45.0 mm × 9.0 mm
	Net weight	16.5 g
Packing	Packing specifications	An antistatic bag and anti-collision foam are provided for each

Information		receiving card. Each packing box contains 40 receiving cards.
	Packing box dimensions	378.0 mm × 190.0 mm × 120.0 mm
Certifications	RoHS, EMC Class B	

Statement
